

PRE-HACKATHON ALEXA CHATBOT

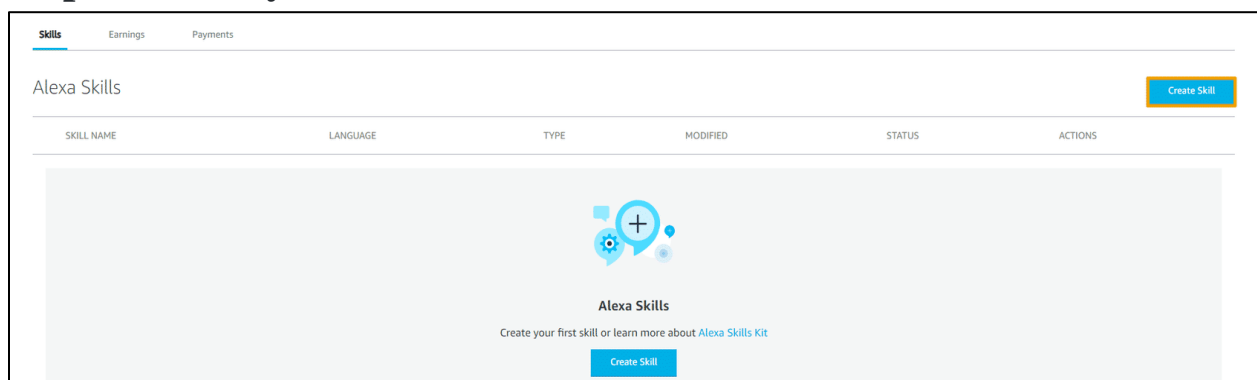

This document guides in building the custom Amazon ALEXA for the intent “Zodiac Sign.”

Step1: Login

To get started, log into the [Alexa developer console](#) with your Amazon Developer account. If you do not have an account, [click here](#) to create one and then login to the [developer console](#).

Step2: Create your skill

- Click Create Skill on the right-hand side of the console. A new page displays.

- Enter your preferred name of skill (e.g. Hackathon Project) In the Skill name field and leave the **Default language** set to **English (US)**.
- You are building a custom skill. **Choose a model to add** to your skill, select **Custom** and **choose a method to host your skill's backend resources**, select **Alexa-Hosted (Python)**. Refer below image.

Create a new skill

Cancel Create skill 5

Model: Custom
Host: Alexa-Hosted (Python)
Hosting Region: US East (N. Virginia) ▼

Skill name
Hackathon Project 1
9/50 characters

Default language
English (US) 2
More languages can be added to your skill after creation

1. Choose a model to add to your skill
There are many ways to start building a skill. You can design your own custom model or start with a pre-built model. Pre-built models are interaction models that contain a package of intents and utterances that you can add to your skill.

Custom 3
Design a unique experience for your users. A custom model enables you to create all of your skill's interactions.

Flash Briefing
Give users control of their news feed. This pre-built model lets users control what updates they listen to.
"Alexa, what's in the news?"

Smart Home
Give users control of their smart home devices. This pre-built model lets users turn off the lights and other devices without getting up.
"Alexa, turn on the kitchen lights"

Music
Give users complete control of their music. This pre-built model lets users search, pause, skip, or shuffle in your skill.
"Alexa, play music by Lady Gaga"

Video
Let users find and consume video content. This pre-built model supports content searches and content suggestions.
"Alexa, play Interstellar"

2. Choose a method to host your skill's backend resources
You can provision your own backend resources or you can have Alexa host them for you. If you decide to have Alexa host your skill, you'll get access to our code editor, which will allow you to deploy code directly to AWS Lambda from the developer console.

Alexa-Hosted (Node.js)
Alexa will host skills in your account up to the AWS Free Tier limits and get you started with a Node.js template. You will gain access to an AWS Lambda endpoint, 5 GB of media storage with 15 GB of monthly data transfer, and a table for session persistence. [Learn more](#)

Alexa-Hosted (Python) 4
Alexa will host skills in your account up to the AWS Free Tier limits and get you started with a Python template. You will gain access to an AWS Lambda endpoint, 5 GB of media storage with 15 GB of monthly data transfer, and a table for session persistence. [Learn more](#)

Provision your own
Provision your own endpoint and backend resources for your skill. This is recommended for skills that have significant data transfer requirements. You will not gain access to the console's code editor.

- Choose a template to add to your skill, Select a Hello World Skill From the given Templates and at the top of the page, Click Choose as per the below image.

Choose a template to add to your skill
Select a skill template from the list below or import a skill shared by the Alexa community as a public Git repository.

Import skill Continue with template 2

1 Hello World Skill
This skill gets you started with skill building by providing basic "Hello World" functionality and rapidly generating a voice response from Alexa. [Learn more](#)

Fact Skill
Build an engaging fact skill about any topic. Alexa will select a fact at random and share it with the user when the skill is invoked. [Learn more](#)
Includes: custom intents

Quiz Game Skill
Build an engaging quiz game for your users. Alexa will pick facts and quiz the users from the list provided by you. [Learn more](#)
Includes: slots, custom intents, session persistence

High-Low Game Skill
Try to guess a target number and Alexa will tell you if the number she had in mind was higher or lower. [Learn more](#)
Includes: slots, custom intents, session persistence

Sauce Boss Skill
Build multi-modal experiences on screen enabled Echo devices. This skill allows a user to ask for a recipe and receive a description and images. [Learn more](#)
Includes: custom intents, Alexa Presentation Language (APL)

- It takes a few moments for AWS to provision resources for your skill. When this process completes, move to the next section.

- **Note:** When you exit and return to the Alexa developer console, find your skill on the **Your Skills** tab. In the **Alexa Skills** list. Click **Edit** to continue working on your skill as per the below image.

Alexa Skills

SKILL NAME	LANGUAGE	MODELS	MODIFIED	STATUS	ACTIONS	
 Hackathon Project <small>View Skill ID</small>	English (US)	Custom	2020-07-06	● In Development	Analytics Edit Delete	

- Click on the **Build** tab and change the invocation name as per your skill as shown in the below image. As this invocation name will be used in testing.
Note: Invocation is the act of beginning an interaction with a custom skill, for example the phrase: “Alexa, get hackathon project” tells Alexa to use the hackathon project skill. The keyword “get hackathon project” is known as invocation name (you can give any name for the skill or invocation).

Invocation

Users say a skill's invocation name to begin an interaction with a particular custom skill. For example, if the invocation name is "daily horoscopes", users can say:

User: Alexa, ask daily horoscopes for the horoscope for Gemini

Skill Invocation Name

get hackathon project

Step 3: Create intent and slots to capture information

In this section, you will make the skill more useful by having it ask the user for their date of birth. So that when the user responds, the skill will understand and repeat the user's zodiac sign back to them.

To do this, you will need to use **utterances, intents, and slots**. You will also learn how to use **dialog management** to have your skill automatically ask follow-up questions to collect the required information. **For example**, if the user says, “**I was born July 12th,**” dialog management will automatically ask the user **what year they were born**.

At the end of this module, your **Zodiac Sign** intent will be able to ask the user a question and listen for the answer further to respond to the user.

Follow the Below Steps to Build your Model:

- Click on Intents tab under the Interaction Model portion and then click on + Add Intent button as shown below. The Add Intent window opens

- Choose "**Create custom intent**" and enter the Intent name for your skill (Eg. **CaptureZodiacSignIntent**), furthermore click Create custom intent. The intent will be created.

- Note:**
 - An **intent** represents an action that fulfills a user’s spoken request. When you create a new custom intent, you provide a name and a list of utterances that users would say to invoke this intent
 - The **sample utterances** are set of likely spoken phrases mapped to the intents. An utterance is what invokes the intent. In response to the birthday question, a user might say - "I was born on November seventh, nineteen eighty-three." You will add this utterance to the CaptureZodiacSignIntent by typing it in exactly the way the user is expected to say it.
 - Slots** are a very powerful accessory for building a custom Alexa skill. For example, the statement “I was born in {month}” means that the user can provide any month to our skill from the slot month.

Intents / CaptureZodiacSignIntent

Sample Utterances (1) ⓘ

What might a user say to invoke this intent?

I was born on November seventh nineteen eighty three

< 1 - 1 of 1 >

- In the Sample Utterances field, type the following, and then press ENTER or click the + icon: **I was born on November seventh nineteen eighty three** Notice that the text does not include **punctuation**.
- From this utterance, there are three key pieces of information to collect: **month, day, and year**. These are called **slots**. You need to let Alexa know which words are **slots and what kind of slots they are**.
- Start with the **month slot**. In the **utterance**, you will replace the word representing the **month (November)** with the word month in **curly braces ({ })**. This creates a slot called **month**. The utterance will then look like this: **I was born on {month} seventh nineteen eighty three**. Follow the below steps to create a **slot**.
 - Select the word in the sample utterance where the slot should go and type the name of the slot in curly braces (**for example, {month}**).

Intents / CaptureZodiacSignIntent

Sample Utterances (1) ⓘ

I was born on {month}

I was born on

Select an Existing Slot

No existing slots

OR

Create a new slot

month

Add

- Repeat this process for the other variable pieces of information (day and year). Your utterance should now look like this: **I was born on {month} {day} {year}**
- In the Sample **Utterances** field, type the following, and then press **ENTER** or click the + icon: **{month} {day} {year}**

- Scroll down the page to **Intent Slots**. This area displays the three slots you have created for this skill.

Intent Slots (3) ⓘ			
ORDER ⓘ	NAME ⓘ	SLOT TYPE ⓘ	ACTIONS
1	month	Select a slot type	Edit Dialog Delete
2	day	Select a slot type	Edit Dialog Delete
3	year	Select a slot type	Edit Dialog Delete

- Slots are assigned from the Slot Type drop-down menu to the right of each slot.
- There are two types of slot types: **custom** and **built-in**. Wherever possible, use built-in slots. Alexa manages the definitions of built-in slots. These slots begin with AMAZON followed by what they define (for example, AMAZON.Month).
- If an applicable built-in slot does not exist, **create a custom slot** in the “Slot Types (0)” section and add all the values it represents.
- To the right of the month slot, select AMAZON.Month from the Slot Type drop-down menu. For the day and year slots, select AMAZON.Ordinal and AMAZON.FOUR_DIGIT_NUMBER respectively as the slot type.

month	AMAZON.Month
day	AMAZON.Ordinal
year	AMAZON.FOUR_DIGIT_NUMBER

- Under ACTIONS click **Edit Dialog**, toggle to make the **slot required**.
- In the Alexa speech prompts field, type “**What month were you born**” and then press **ENTER** or click the + icon, you can also provide User utterances in the next field.

Slot Filling

Is this slot required to fulfill the intent? ⓘ
☒

Alexa speech prompts ⓘ

What month were you born

- Repeat the process for the **day** and **year** slots.

- Delete the **HelloWorldIntent** by clicking delete button to the right of it. When prompted, click **Delete Intent**.
- Be careful to delete **HelloWorldIntent** and not **CaptureZodiacSignIntent**.

- At the top of the page, click **Save Model** and **Build Model**.

- When you click **Build Model**, your skill starts to build the training data that will help Alexa know how to map what the user says to your skill's intents. It may take a minute for the model to build.

Step 4: Let's Start Building the Model in the Backend.

In this step, you will update your backend code to respond to the user when they open the skill.

Click the **Code tab**, you can see an online code editor with some files already set up for you to get started. In particular, you'll see the following three files in the lambda sub-directory:

- **lambda_function.py:** This is the main entry point of the backend service. All the request data from the Alexa intent is received here and is supposed to be returned from this file only.
- **requirements.txt:** This file contains the list of Python packages that are being used in this project.
- **utils.py:** This file contains some utility functions required for the lambda function.

Within the **lambda_function.py**, to define how your skill responds to a request, you will define a handler for each intent. There are two pieces to a handler:

- **can_handle()** recognizes each incoming request that alexa receives.
- **handle()** returns an appropriate response.
 - The **speak_output** variable contains the string of words the skill should say back to the user when they launch the skill.

What should happen when a user launches the Zodiac Sign Skill?

In this case, you want the skill to simply confirm that the user opened it by saying, **"Hello! Welcome to Zodiac Signs. When were you born?"**

- Within the **LaunchRequestHandler** object, find the **handle()** function, and the line that begins **speak_output**. Replace that line with the following:

```
speak_output = "Hello! Welcome to Hackathon Project. Would you like to now  
your zodiac sign?"
```

- Within the **LaunchRequestHandler**, you will find the **.ask()** function:
 - The **ask()** function tells the skill to wait for the user to reply, rather than simply exiting.
 - It allows you to specify a way to ask the question to the user again, if they don't respond.
 - A best practice is to make your reprompt text different from your initial speech text.
 - Perhaps for a variety of reasons the consumer did not respond. The skill will again pose the initial question but do so in a natural manner. The reprompt will provide

the consumer with more information to help generate a response. Develop a new variable called `reprompt_text` to define the reprompt text.

- Within the `LaunchRequestHandler`, in the `handle()` function, find the line that begins **`speak_output`** . Create a new line below it and copy and paste the following code on the new line:

```
reprompt_text = "I was born Nov. 6th, 2014. When were you born?"
```

- Notice the reprompt gives an example of what Alexa expects the user to say by having Alexa provide her own birthday in the format she is looking for. Providing examples like this is a best practice.
- Now you want the code to pass the `reprompt_text` variable to the `.ask()` function.
- Within the `LaunchRequestHandler`, in the `handle()` function, replace `.ask(speak_output)` with `.ask(reprompt_text)`
- If you look at the code below, you will notice the `HelloWorldIntentHandler`. But you deleted the `HelloWorldIntent`, right? Not entirely. The intent is gone from the front end, but the backend handler is still there. You need a new handler, so make things easier and reuse this handler for a new one called `CaptureZodiacSignIntentHandler`.
- Find the line that starts the class `HelloWorldIntentHandler`. On that line, rename `HelloWorldIntentHandler` to `CaptureZodiacSignIntentHandler`.
- Within the `CaptureZodiacSignIntentHandler`, on the line that begins `return ask_utils.is_intent_name("HelloWorldIntent")`, change `'HelloWorldIntent'` to `'CaptureZodiacSignIntent'`
- This change ensures that the `can_handle()` function will be invoked when a `'CaptureZodiacSignIntent'` request comes through.
- Now you need to update the logic within the handler, Start by creating three variables in the handler to save the slots the skill is collecting.
- Within the `CaptureZodiacSignIntentHandler`, find the line that begins `def handle(self, handler_input):` comment the `speak_output = "Hello World!"` line and create a new line below it.
- Copy and paste the following code on the new line:

```
slots = handler_input.request_envelope.request.intent.slots
year = slots["year"].value
month = slots["month"].value
day = slots["day"].value
```

Step 5: Steps to Create Your CSV File in Google Sheets to Build an Alexa Skill with Python and Aws Lambda.

Create Your Google Sheet with Data

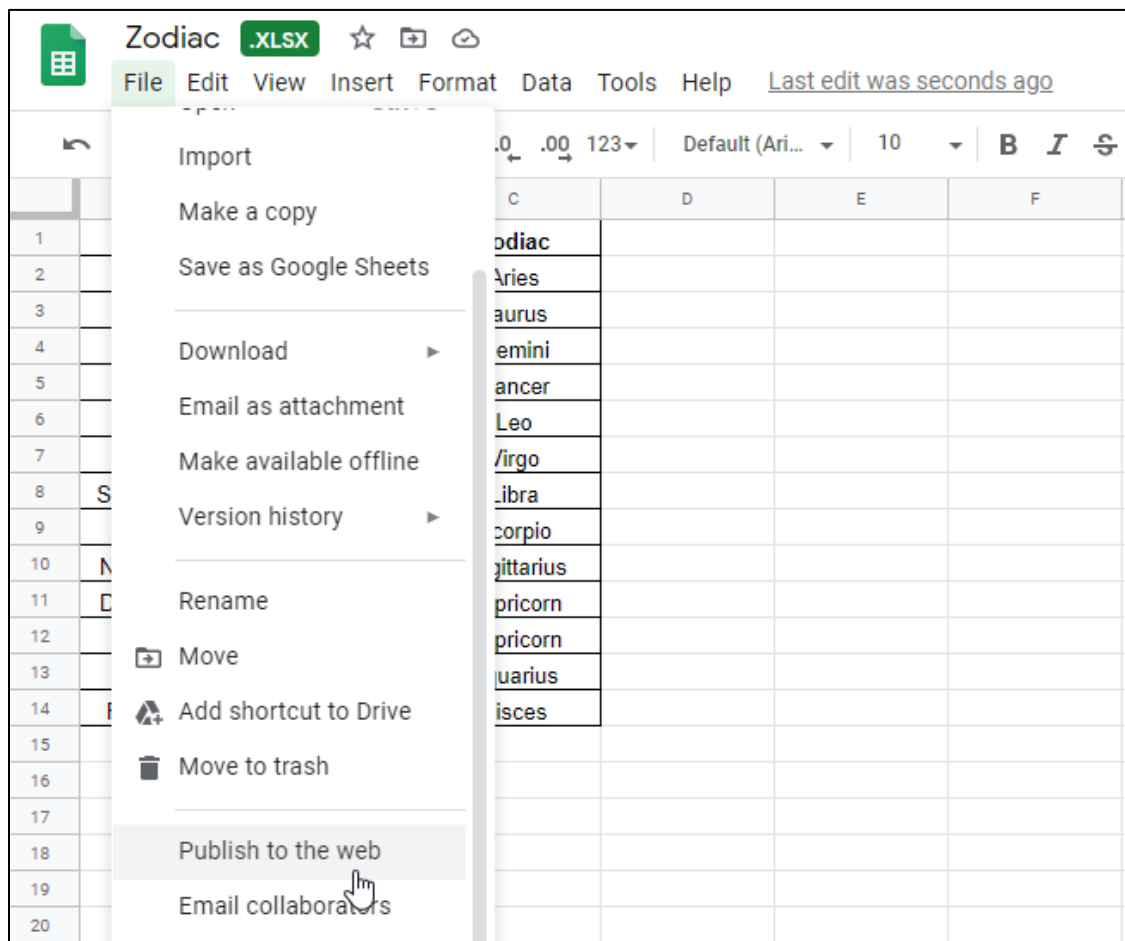

Let's imagine we want to create an Alexa skill that asks for my birthday and replies to me with my zodiac sign. Hence, we shall update the Google sheet with the features and labels.

[Click Here](#) to See the Provided Zodiac Signs Csv.

	Zodiac .XLSX ☆ 📄 ☁					
	File Edit View Insert Format Data Tools Help Last edit was seconds ago					
	100% \$ % .0 .00 123 Default (Ari... 10 B I

Convert Your Spreadsheet into a CSV

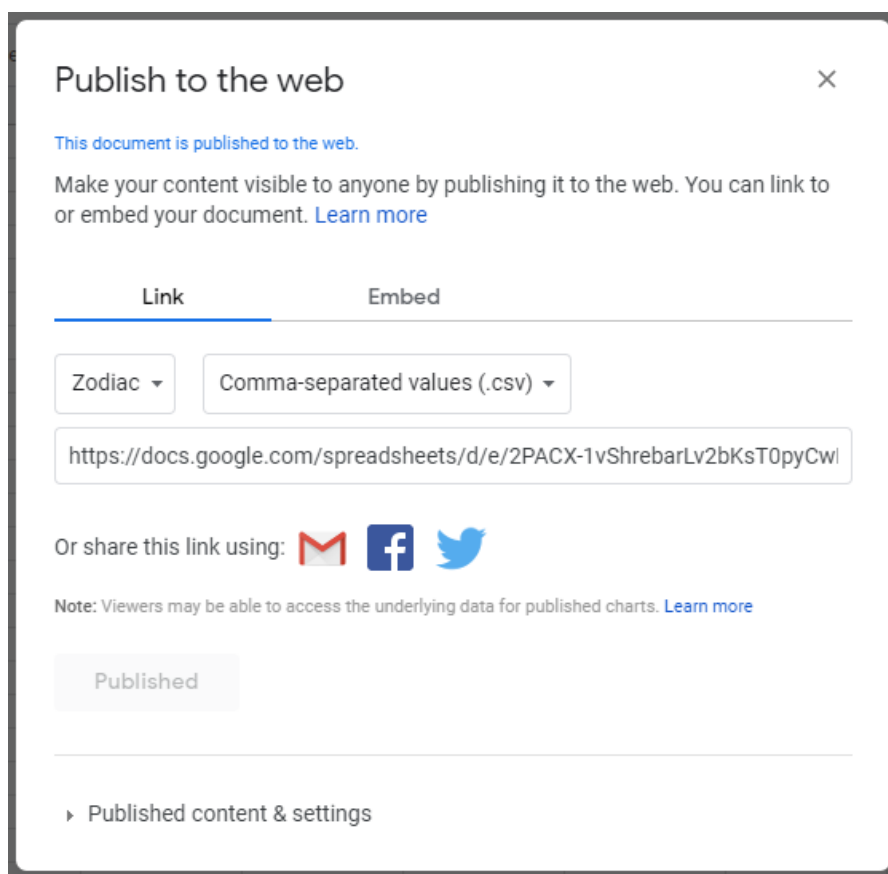

First, you need to publish your spreadsheet to the web, using File → Publish To Web in your spreadsheet.

A pop up appears on clicking “**Publish To Web**”, Follow the below steps to get the link.

- From **Entire Document** dropdown → Choose a particular sheet name you are working on.
- From **Web page** dropdown → Pick **comma-separated values (CSV)**

After which your screen looks like this

Make sure you copy that link from the textbox which will be used to extract data in the process of developing your skill.

Start Editing the Alexa skill:

- Under Code Tab, Double-click the **requirements.txt** file in the pane on the left. The file opens in the editor. Create a new line and add 'pandas' at the end of the file.

```
boto3==1.9.216
ask-sdk-core==1.11.0
pandas
```

- Open **lambda_function.py**. The new dependency allows you to use the pandas' data frames to read data from the given URL. Now, you need to add import statements in your code. Find the line that begins **import logging**. Create a new line just below it, and copy and paste the following code:

```
import pandas as pd
import requests
import io
import calendar
```

- Within the **CaptureZodiacSignIntentHandler**, in the **handle()** function, create a new line and copy and paste the following code:

```
#ENTER YOUR URL HERE
url = "https://docs.google.com/spreadsheets/d/e/2PACX-1vRGwsyu-
sfmaIJRVJakiSBHdUhzWtsJwRIGZ-
CjGy0tQbx7wUfW1LuwNmWQnatUNBSd50vK_fRvg9L/pub?gid=0&single=true&output=
csv"
csv_content = requests.get(url).content
df = pd.read_csv(io.StringIO(csv_content.decode('utf-8')))
```

- Now as such you have a data frame in control, you shall be able to **implement a code to extract the zodiac sign** from the data frame relevant to the users date of birth.
- For the provided Zodiac Signs Csv link follow the below steps to extract the data:
 - Create a new function above **handle(self, handler_input)** function named filter
Copy and paste the following code:

```
def filter(self, X):
    date = X.split()
    month = date[0]
    month_as_index = list(calendar.month_abbr).index(month[:3].title())
    day = int(date[1])
    return (month_as_index, day)
```

- Inside **handle()** method copy paste the following code:

```
zodiac = "
month_as_index = list(calendar.month_abbr).index(month[:3].title())
usr_dob = (month_as_index, int(day))
for index, row in df.iterrows():
    if self.filter(row['Start']) <= usr_dob <= self.filter(row['End']):
        zodiac = row['Zodiac']
```

- After the necessary implementation. Within the CaptureZodiacSignIntentHandler, in the handle() function, find the line that begins with **speak_output** . Replace that line with the following code

```
speak_output = 'I see you were born on the {day} of {month} {year}, which means that your zodiac
sign will be {zodiac}.'.format(month=month, day=day, year=year, zodiac=zodiac)
```

- Your **CaptureZodiacSignIntentHandler** class should now look like:

```
class CaptureZodiacSignIntentHandler(AbstractRequestHandler):
    """Handler for Hello World Intent."""
    def can_handle(self, handler_input):
        # type: (HandlerInput) -> bool
        return ask_utils.is_intent_name("CaptureZodiacSignIntent")(handler_input)

    def filter(self, X):
        date = X.split()
        month = date[0]
        month_as_index = list(calendar.month_abbr).index(month[:3].title())
        day = int(date[1])
        return (month_as_index, day)

    def handle(self, handler_input):
        slots = handler_input.request_envelope.request.intent.slots
        year = slots["year"].value
        month = slots["month"].value
        day = slots["day"].value
        #ENTER YOUR URL HERE
        url = "https://docs.google.com/spreadsheets/d/e/2PACX-1vRGwsyu-  
sfmaIJRVJakiSBHdUUhZWtsJwtRIGZ-  
CjGy0tQbx7wUfW1LuwNmWQnatUNBSd50vK_fRvg9L/pub?gid=0&single=true&output=csv"
        csv_content = requests.get(url).content
        df = pd.read_csv(io.StringIO(csv_content.decode('utf-8')))
        zodiac = ""
        month_as_index = list(calendar.month_abbr).index(month[:3].title())
        usr_dob = (month_as_index, int(day))
        for index, row in df.iterrows():
            if self.filter(row['Start']) <= usr_dob <= self.filter(row['End']):
                zodiac = row['Zodiac']

        speak_output = 'I see you were born on the {day} of {month} {year}, which means that your zodiac sign  
will be {zodiac}.'.format(month= month, day=day, year=year, zodiac=zodiac)

        return (handler_input.response_builder
                .speak(speak_output)
                .response)
```

- Scroll down in the code until you find the line that begins **sb = SkillBuilder()**.
- Replace the line **sb.add_request_handler(HelloWorldIntentHandler())** with **sb.add_request_handler(CaptureZodiacSignIntentHandler())**

Your handler code at the bottom of the file should now look like:

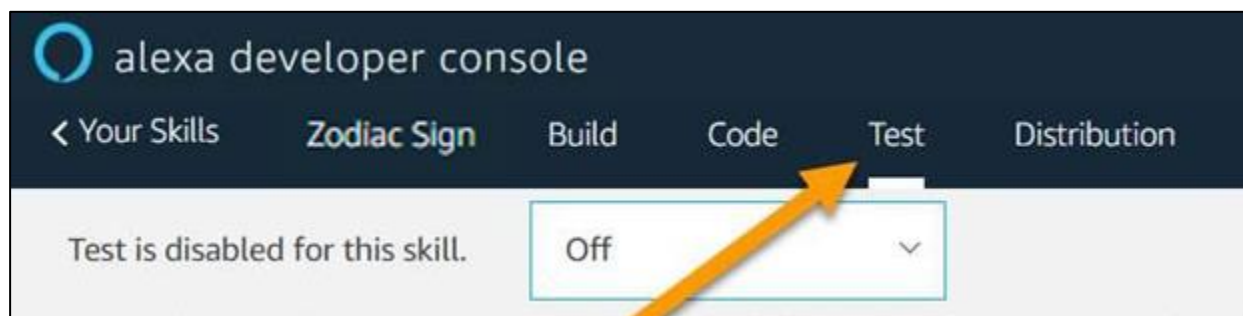

```
sb = SkillBuilder()
sb.add_request_handler(LaunchRequestHandler())
sb.add_request_handler(CaptureZodiacSignIntentHandler())
sb.add_request_handler(HelpIntentHandler())
sb.add_request_handler(CancelOrStopIntentHandler())
sb.add_request_handler(SessionEndedRequestHandler())
sb.add_request_handler(IntentReflectorHandler()) # make sure IntentReflectorHandler is last so it
doesn't override your custom intent handlers
sb.add_exception_handler(CatchAllExceptionHandler())
lambda_handler = sb.lambda_handler()
```

- Click Save and Deploy. Because of the new handler, your skill will take a few moments to deploy.

Step 6: Test your skill inside the developer console

Now it is time to test the skill. Start by activating the test simulator.

An alert may appear requesting to use your computer's microphone. **Click Allow** to enable testing the skill with your voice, just like if you were talking to an Alexa-enabled device.

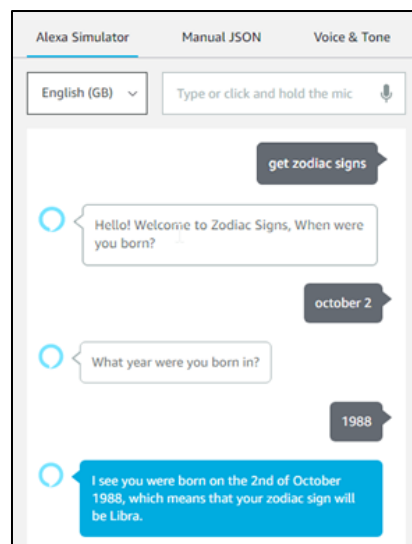

From the drop-down menu at the top left of the page, select **Development**.

There are two ways to test your skill in the console. The user can type the “**open invocation name**” (Eg. open get Zodiac Sign) not case sensitive, into the box at the top left and press ENTER, **or** click and hold the microphone icon and say, “**open get Zodiac Sign**” As shown in the below image, **Be precise—spelling matters!**

Alexa should respond with, "I see you were born on the {day} of {month} {year}, which means that your zodiac sign will be {zodiac}." As shown in the below image.

Go ahead and test what happens if you provide only year, day & year, or other combinations. Alexa should prompt you for any slot values that you omit.
